Department Scheduling Setup - Accounting (KCACCT_BU)

Home and Alternate Pavilions

A pavilion is the equivalent of a building. Your home and alternate pavilion settings tell the system how to assign a 'quality' to the rooms that are available to be assigned to your delivery. To assign a quality, you must first supply a home pavilion. The home pavilion is the pavilion that the scheduler requests in the DCU. If the system is unable to find a room in the home pavilion, it will search the alternate pavilions instead. The value of the alternate pavilion describes which pavilion has a better quality.

In the following example if the scheduler requests a room in PAV A and no rooms are available it will search PAV B, D and M. Rooms in PAV B will have greater quality than rooms in PAV D. Rooms in PAV D will have a better quality than rooms in PAV M. If the scheduler requests a room in PAV Q and no rooms are available, the system will search PAV T, X and H. Rooms in PAV T and X have equal and greater quality than rooms in PAV H.

Below you will find your home and alternate pavilions as they exist in production today. Please review this information and make changes as necessary.

If I request a room in this pavilion:	Rank (quality)	I would also accept a room in these pavilions, in this order
PAV A	1	PAV B
	2	PAV D
	3	PAV M
PAV Q	1	PAV T
	1	PAV X
	2	PAV H

Department Scheduling Setup - English (KCENG_AS)

Home and Alternate Pavilions

A pavilion is the equivalent of a building. Your home and alternate pavilion settings tell the system how to assign a 'quality' to the rooms that are available to be assigned to your delivery. To assign a quality, you must first supply a home pavilion. The home pavilion is the pavilion that the scheduler requests in the DCU. If the system is unable to find a room in the home pavilion, it will search the alternate pavilions instead. The value of the alternate pavilion describes which pavilion has a better quality.

In the following example if the scheduler requests a room in PAV A and no rooms are available it will search PAV B, D and M. Rooms in PAV B will have greater quality than rooms in PAV D. Rooms in PAV D will have a better quality than rooms in PAV M. If the scheduler requests a room in PAV Q and no rooms are available, the system will search PAV T, X and H. Rooms in PAV T and X have equal and greater quality than rooms in PAV H.

Below you will find your home and alternate pavilions as they exist in production today. Please review this information and make changes as necessary.

If I request a room in this pavilion:	Rank (quality)	I would also accept a room in these pavilions, in this order

If the system is unable to find a room in the home pavilion, it will search the alternate pavilions instead. The value of the alternate pavilion describes which pavilion has a better quality.

In the following example if the scheduler requests a room in PAV A and no rooms are available it will search PAV B, D and M. Rooms in PAV B will have greater quality than rooms in PAV D. Rooms in PAV D will have a better quality than rooms in PAV M. If the scheduler requests a room in PAV Q and no rooms are available, the system will search PAV T, X and H. Rooms in PAV T and X have equal and greater quality than rooms in PAV H.

Below you will find your home and alternate pavilions as they exist in production today. Please review this information and make changes as necessary.

Department Scheduling Setup - Military Science (KCMSCI_VA)

Home and Alternate Pavilions

A pavilion is the equivalent of a building. Your home and alternate pavilion settings tell the system how to assign a 'quality' to the rooms that are available to be assigned to your delivery. To assign a quality, you must first supply a home pavilion. The home pavilion is the pavilion that the scheduler requests in the DCU. If the system is unable to find a room in the home pavilion, it will search the alternate pavilions instead. The value of the alternate pavilion describes which pavilion has a better quality.

In the following example if the scheduler requests a room in PAV A and no rooms are available it will search PAV B, D and M. Rooms in PAV B will have greater quality than rooms in PAV D. Rooms in PAV D will have a better quality than rooms in PAV M. If the scheduler requests a room in PAV Q and no rooms are available, the system will search PAV T, X and H. Rooms in PAV T and X have equal and greater quality than rooms in PAV H.

Below you will find your home and alternate pavilions as they exist in production today. Please review this information and make changes as necessary.

If I request a room in this pavilion:	Rank (quality)	I would also accept a room in these pavilions, in this order
PAV A	1	PAV B
	2	PAV D
	3	PAV M
PAV Q	1	PAV T
	1	PAV X
	2	PAV H

Home and Alternate Pavilions

A pavilion is the equivalent of a building. Your home and alternate pavilion settings tell the system how to assign a 'quality' to the rooms that are available to be assigned to your delivery. To assign a quality, you must first supply a home pavilion. The home pavilion is the pavilion that the scheduler requests in the DCU. If the system is unable to find a room in the home pavilion, it will search the alternate pavilions instead. The value of the alternate pavilion describes which pavilion has a better quality.

In the following example if the scheduler requests a room in PAV A and no rooms are available it will search PAV B, D and M. Rooms in PAV B will have greater quality than rooms in PAV D. Rooms in PAV D will have a better quality than rooms in PAV M. If the scheduler requests a room in PAV Q and no rooms are available, the system will search PAV T, X and H. Rooms in PAV T and X have equal and greater quality than rooms in PAV H.

Below you will find your home and alternate pavilions as they exist in production today. Please review this information and make changes as necessary.

If I request a room in this pavilion:	Rank (quality)	I would also accept a room in these pavilions, in this order
PAV A	1	PAV B
	2	PAV D
	3	PAV M
PAV Q	1	PAV T
	1	PAV X
	2	PAV H
